PASSWORD SAFETY

A quick guide for every staff member

1. Use a unique password

Create a long password or passphrase for each account. Use the approved password manager to generate and store them safely.

Why? If one website is breached, a unique password helps protect your other accounts.

2. Turn on two-step verification

Enable multi-factor authentication (MFA) wherever available, especially for work email and important systems. Never approve an unexpected sign-in request.

Why? MFA adds another layer of protection if someone learns your password.

3. Act quickly if something looks wrong

Report suspicious login alerts, unexpected MFA prompts, phishing messages or a possibly exposed password to IT/security. Change an exposed password using the official service.

Why? Fast reporting helps the organisation respond before an attacker causes more damage.

Remember
• Never reuse your work password on other sites. • Never share your password or type it into an unfamiliar password-checking website. • Use only your organisation's approved password manager and security tools.

Strong habits protect you, your team and company data.
